Note: Physical capacity is the total number of beds that could be accommodated without significant renovations. For example, a room with two headwalls and two sets of gasses is a semi-private room, even if it has one bed in it. A room with one headwall and one set of gasses is counted as a private room, even if it is the same size as other semi-private rooms, since construction would be required to convert it to semi-private use.

Expand the number of rows on this form as needed.

For the Emergency Department treatment capacity, please use the categories in the Supplemental Survey: ED Treatment Capacity (as of June 1, 2005).

The Operating Room and procedure room capacity should use the standard categories used in the Ambulatory Surgery Provider Directory Information, 2005.
