BEFORE THE

UNIVERSITY OF MARYLAND
MARYLAND HEALTH

MEDICAL CENTER
CARE COMMISSION

Docket No.: 17-23-CP006

************************************************************

STAFF REPORT & RECOMMENDATION

CERTIFICATE OF ONGOING PERFORMANCE
FOR CARDIAC SURGERY SERVICES

May 16, 2019
I. INTRODUCTION

A. Background

In 2012, the Maryland legislature passed a law directing the Maryland Health Care Commission (“MHCC” or “Commission”) to adopt new regulations for the oversight of both cardiac surgery and percutaneous coronary intervention (“PCI”) services. The law directed MHCC to establish a process and minimum standards for obtaining and maintaining a Certificate of Ongoing Performance that incorporates to the extent appropriate recommendations on standards for cardiac surgery services and PCI services from a legislatively-mandated Clinical Advisory Group (“CAG”). The law also directed MHCC to incorporate several specific requirements in its regulations.

After extensive discussion with the CAG comprised of national and regional experts and considering the CAG’s and other stakeholders’ recommendations, COMAR 10.24.17, the Cardiac Surgery and PCI Services chapter (“Cardiac Surgery Chapter”) of the State Health Plan for Facilities and Services (“State Health Plan”) was replaced effective August 2014. The Cardiac Surgery Chapter was subsequently replaced in November 2015 and again in January 2019. The primary changes to the Cardiac Surgery Chapter that affect cardiac surgery programs have been an evolving definition of cardiac surgery that may affect a hospital’s compliance with volume standards for a Certificate of Ongoing Performance for cardiac surgery and a change to the benchmark used to evaluate hospitals’ risk-adjusted mortality rates. MHCC staff was unable to obtain benchmark information for risk-adjusted mortality rates consistent with the regulations adopted in November 2015 that reflected the recommendations of the CAG. As a result, the standard addressed by applicants was determined to be inapplicable; however, information on how hospitals performed relative to the newly adopted mortality standard is included in staff reports.

The Cardiac Surgery Chapter contains standards for evaluating the performance of established cardiac surgery services in Maryland and determining whether a hospital should be granted a Certificate of Ongoing Performance. A Certificate of Ongoing Performance for cardiac surgery authorizes a hospital to continue to provide these services for a period of time specified by the Commission that cannot exceed five years. At the end of the time period, the hospital must again demonstrate that it continues to meet the requirements in COMAR 10.24.17.07B for a Certificate of Ongoing Performance in order for the Commission to renew the hospital’s authorization to provide cardiac surgery services.

B. Applicant

University of Maryland Medical Center

The University of Maryland Medical Center (“UMMC”) is a 789-bed general acute care hospital located in Baltimore City, Maryland. The hospital’s cardiac surgery program was established prior to the requirement for a Certificate of Need to establish a cardiac surgery program.
Health Planning Region

Four health planning regions for adult cardiac surgery services are defined in COMAR 10.24.17. UMMC is located in Baltimore/Upper Shore health planning region. This region includes Anne Arundel, Baltimore, Caroline, Carroll, Cecil, Harford, Howard, Kent, Queen Anne’s, and Talbot Counties, and Baltimore City. Four other hospitals in this health planning region provide cardiac surgery services: MedStar Union Memorial Hospital; Sinai Hospital of Baltimore; The Johns Hopkins Hospital; and University of Maryland St. Joseph Medical Center.

C. Staff Recommendation

MHCC staff recommends that the Commission approve UMMC’s application for a Certificate of Ongoing Performance to continue providing cardiac surgery services. A Certificate of Ongoing Performance is granted when a cardiac surgery program demonstrates compliance with specific standards for quality. A description of UMMC’s documentation and MHCC staff’s analysis of this information follows.

II. PROCEDURAL HISTORY

UMMC filed a Certificate of Ongoing Performance application on December 14, 2017. On April 30, 2019, UMMC submitted responses to requests for additional information, and clarifications concerning its application for a Certificate of Ongoing Performance for cardiac surgery services.

III. PROJECT CONSISTENCY WITH REVIEW CRITERIA

Data Collection

*COMAR 10.24.17.07B (3) Each cardiac surgery program shall participate in uniform data collection and reporting. This requirement is met through participation in STS-ACSD, with submission of duplicate information to the Maryland Health Care Commission. Each cardiac program shall also cooperate with the data collection requirements deemed necessary by the Maryland Health Care Commission to assure a complete, accurate, and fair evaluation of Maryland’s cardiac surgery programs.*

UMMC participates in the Society of Thoracic Surgeons’ (“STS”) adult cardiac surgery data registry (“STS-ACSD”) data submission and also submits STS-ACSD data to MHCC staff as required. UMMC noted that staff responsible data entry in the STS-ACSD attend an annual training conference and participate in ongoing training available through the STS web site and the hospital’s third party vendor.

Staff Analysis and Conclusion

UMMC has complied with the submission of STS-ACSD data to MHCC in accordance with the established schedule. In 2015, MHCC staff conducted an audit of the STS-ACSD data for each Maryland hospital to validate that all hospitals submitted accurate and complete
information to the STS-ACSD. Advanta Government Solutions, MHCC’s contractor for the audit, did not identify any concerns regarding the accuracy or completeness of UMMC’s STS data for the period July 1, 2014 through December 31, 2014. MHCC Staff concludes that UMMC is compliant with this standard.

Quality

COMAR 10.24.17.07B(4)(a) and (b) The chief executive officer of the hospital shall certify annually to the Commission that the hospital fully complies with each requirement for conducting and completing quality assurance activities specified in this chapter, including those regarding internal peer review of cases and external review of cases. The hospital shall demonstrate that it has taken appropriate action in response to concerns identified through its quality assurance process.

UMMC explained that it conducts quality assurance for its cardiac surgery program through monthly meetings to review cases with morbidity and mortality, quarterly peer review meetings, and multidisciplinary quality and performance improvement meetings held at least six times a year. The hospital also convenes ad hoc performance improvement team meetings as needed throughout the year based on data, events, and program planning.

The monthly meetings to review cardiac surgery cases with morbidity and mortality are attended by cardiac surgeons, cardiac surgery residents, the critical care team, cardiac surgery nurse practitioners, representatives from the Division of Quality and Safety, and other disciplines by invitation as appropriate. The quarterly peer review meetings focus on cases that have been referred by any one of several divisions within the hospital. UMMC provided a chart with an overview of the peer review process. This chart shows that cases are screened by a committee of six members and the actions taken for each of four possible conclusions.

UMMC reported that multi-disciplinary quality and performance improvement meetings focus on reviewing results from STS reports and other sources of data and developing action plans, as appropriate. Attendees at these meetings include the chief of cardiac surgery, the cardiac surgery intensive care unit medical director, the program anesthesiologist, quality physician, the senior quality and safety coordinator, and nurses that are members of the perioperative outpatient quality team. UMMC provided meeting minutes for six meetings held between July 2015 and September 2017.

The president of UMMC, Dr. Mohan Suntha, submitted a letter stating that UMMC is committed to identifying areas of improvement in the quality and outcomes of the hospital’s cardiac surgery program. Dr. Suntha also stated that UMMC will provide annually or upon request a report of the quality assurance activities of the program.

Staff Analysis and Conclusion

UMMC provided information documenting its quality assurance activities and the actions taken in response to any quality concerns identified. MHCC staff concludes that UMMC complies with this standard.
Performance Standards

COMAR 10.24.17.07B(5)(a) A cardiac surgery program shall meet all performance standards established in statute or in State regulations. The hospital shall maintain an STS-ACSD composite score for CABG of two stars or higher. If the composite score for CABG from the STS-ACSD is one star for two consecutive cycles, the program will be subject to a focused review. If the composite score for CABG from the STS-ACSD is one star for four consecutive rating cycles, the hospital’s cardiac surgery program shall be evaluated for closure based on a review of the hospital’s compliance with State regulations and recently completed or active plan of correction.

Staff Analysis and Conclusion

UMMC has consistently maintained an STS composite score for coronary bypass graft (“CABG”) surgeries of two stars or higher, as required. Table 1 shows the star ratings for each of six overlapping 12-month periods, the volume of isolated CABG cases included in the ratings for each period, and the overall percentage of UMMC’s volume of cardiac surgery included in the STS ratings for isolated CABG cases. As shown in Table 1, approximately 39 to 45 percent of UMMC’s cardiac surgery volume is included in the composite STS star ratings for the period January 2015 through June 2018. Hospitals with cardiac surgery programs typically perform multiple types of cardiac surgery or may perform CABG in combination with other cardiac procedures, but the STS ratings shown in Table 1 are based on only isolated CABG procedures. For an individual patient who requires a different type of cardiac surgery, the information included in Table 1 may not be relevant. However, the Cardiac Surgery Chapter uses isolated CABG as a reference point based not only on the recommendations of the Clinical Advisory Group but also on the continued advice of its current Cardiac Services Advisory Committee, which includes cardiac surgeons and interventional cardiologists. Isolated CABG is one of the most common procedures performed, which allows for a consistent and fair basis for comparing programs and evaluating the overall performance of hospitals, with respect to one type of cardiac surgery.

Sources: UMMC submitted copies of its star ratings and CABG volume to MHCC for each time period shortly after receiving the information from STS; total cardiac surgery volume is based on MHCC staff analysis of HSCRC discharge abstract for January 2015 – June 2018.

1 The maximum number stars awarded is three stars. Two stars indicate that a program is neither significantly better nor worse than the national average for cardiac surgery programs participating in the STS-ACSD.
2 Isolated CABG cases are cases in which only CABG is performed. The number of eligible procedures ranges within the components of the star rating; the number in the table reflects the number of eligible procedures for the mortality component.
3 Cardiac surgery case volume is based on counting discharges with any procedure code that is included in the definition of open-heart surgery in COMAR 10.24.17, effective in November 2015, and using the procedure date to categorize cases by reporting period.

The STS composite star rating for CABG surgeries has four components. The first component is the absence of operative mortality, which is measured by the percentage of patients who do not die during the hospitalization for CABG surgery or within 30 days of the surgery, if discharged.¹ The second component is the absence of major morbidity, which is defined to include any one of the following: reoperation; stroke; kidney failure; infection of the chest wound from surgery; or prolonged support by a breathing machine.² For the first two components, STS adjusts the results in each case based on the severity of illness for each patient. The third component is use of at least one internal mammary artery, which have been known for more than a decade to function longer than a vein graft.³ The fourth component is receipt of all four specific perioperative medications that are believed to improve patient outcomes. The first component, the absence of operative mortality carries the most weight in the overall composite rating, approximately 80%.⁴ Nationally, the vast majority of programs receive a two-star rating, indicating the program did not

perform significantly worse or better than the average for all participants in the STS-ACSD, at a statistically significant level.⁵

**COMAR 10.24.17.07B (5)(b)** The hospital shall maintain a risk-adjusted mortality rate that is consistent with high quality patient care. A hospital with an all-cause 30-day risk-adjusted mortality rate for a specific type of cardiac surgery, such as CABG cases, that exceeds the statewide average beyond the acceptable margin of error calculated for the hospital by the Commission is subject to a focused review. The acceptable margin of error is the 95 percent confidence interval calculated for the hospital’s all-cause 30-day risk-adjusted mortality rate for a specific type of cardiac surgery case.

**Staff Analysis and Conclusion**

This standard is not applicable because hospitals and MHCC staff were not able to obtain a valid statewide average for all-cause 30-day risk adjusted mortality. However, MHCC staff has provided information below on how UMMC performed on the revised standard adopted in regulations that became effective January 14, 2019.

The difference between UMMC’s all-cause 30-day risk adjusted operative mortality rate for isolated CABG cases and the national average is not statistically significant in any of the 12-month reporting periods between January 2015 and June 2018. A hospital’s performance on this measure is acceptable as long as the hospital’s risk adjusted operative mortality rate is similar or better than the national average for participants in the STS-ACSD. As shown in Table 2, for each of the six reporting periods, UMMC’s confidence interval for its all-cause risk adjusted operative mortality rate for isolated CABG includes the national average, indicating that UMMC performed similar to the national average for all participants in the STS-ACSD. The results are shown graphically in Figure 1. In Figure 1, an ‘X’ indicates the national average, and a triangle indicates the performance for UMMC. As shown in Figure 1, the national average falls within the CI for UMMC’s performance in each reporting period. MHCC staff concludes that UMMC would have met the current performance standard, if it had been applicable between January 2015 and June 2018.

Source: STS analysis of data from all Maryland hospitals with cardiac surgery programs.

Notes: It is not valid to compare Maryland hospitals to each other and rank them based on the risk-adjusted operative mortality rates for individual hospitals. The risk-adjusted operative mortality rates and confidence intervals only provide information on whether a hospital has performed significantly worse or better relative to the national average operative mortality rate at a statistically significant level. Operative mortality rates include in-hospital patient deaths following isolated CABG surgery and deaths for any reason within 30 days of isolated CABG surgery.
Figure 1: All-Cause 30-Day Risk-Adjusted Operative Mortality Rates for Isolated CABG: UMMC Compared to the National Average by Reporting Period

January 2015 - December 2015

January 2016 - December

January 2017 - December 2017

July 2017 - June 2018

Key
UMMC 95% C.I.  
UMMC Mortality Rate  
National Average Mortality Rate
Across all Maryland hospitals, the all-cause risk adjusted operative mortality rates for isolated CABG fall within a relatively narrow range: for the 12-month period January 2015 to December 2015, the rates for Maryland cardiac surgery programs ranged from zero to 2.4%; for the 12-month period ending June 30, 2016, the rate range was zero to 2.7%; for CY 2016, the rate range was zero to 3.4%; for the 12-month period ending June 30, 2017, the rate range was zero to 5.8%; for CY 2017, the rate range was 0.4% to 5.2%; and, for the 12-month period ending June 30, 2018, the rate range was 0.4% to 3.8%. Given the relatively low rates for risk adjusted operative mortality across most programs and the volume of cases typically performed at individual hospitals, this performance measure cannot be used to discriminate meaningfully among programs, except to identify outliers relative to the national average.

**Volume Requirements**

*COMAR 10.24.17.07B (6)(a) A cardiac surgery program shall maintain an annual volume of 200 or more cases.*

UMMC reported a volume of 864 cardiac surgery cases for fiscal year (“FY”) 2016, 999 cases for fiscal year 2017, and 266 cases for first quarter of fiscal year 2018.

**Staff Analysis and Conclusions**

Based on MHCC staff’s analysis of the Health Services Cost Review Commission data, UMMC performed a total of 763 adult cardiac surgery cases in FY 2016, 797 cases in FY 2017 and 778 cases in FY 2018. MHCC staff concludes that these case counts may differ due differences in the definitions of adult cardiac surgery used by MHCC and UMMC. UMMC reported cardiac surgery case volume based on the APR-DRG codes rather than the ICD-9 and ICD-10 procedure codes that define cardiac surgery in COMAR 10.24.17. Staff notes that the definition of cardiac surgery changed in November of 2015 with the adoption of revised regulations, COMAR 10.24.17. The ICD-9 procedure codes were replaced by ICD-10 procedure codes beginning October 1, 2015, and an official crosswalk between the ICD-10 and ICD-9 codes was adopted only recently in the regulations effective January 2019. MHCC staff concludes that UMMC meets the annual volume requirement, by exceeding a volume of 200 cardiac surgery cases for the three most recent fiscal years for which data is available.

**IV. RECOMMENDATION**

Based on the above analysis and the record in this review, MHCC staff concludes that UMMC meets all of the requirements for a Certificate of Ongoing Performance found in COMAR 10.24.17.07B. The Executive Director of the Maryland Health Care Commission recommends that the Commission issue a Certificate of Ongoing Performance that permits UMMC to continue providing cardiac surgery services for the next four years.
