

## Safeguarding Privacy and Security in Telehealth

### Tips to Keep Your Practice Safe

#### Overview

The COVID-19 public health emergency altered a lot of ways we do business. A notable change in health care has been the expanded use of telehealth. Telehealth is a tool that leverages information technology (IT) to deliver patient care and other health services in a safe and convenient way. It allows practices to reach patients in new ways, which has helped them remain operational during the public health emergency.

#### What's phishing?

Phishing is an attempt to trick practice staff into giving out valuable information, such as credentials, insurance information, or medical records. These emails often appear to come from a legitimate source (e.g., accounts payable), which makes them harder to detect.<sup>4</sup> Phishing is a common way hackers deploy ransomware by getting a victim to click on a malicious link that denies access to patient records and other electronic systems until a ransom is paid.<sup>5</sup>

It's important for practices to be mindful of IT-related risks involved with collecting, processing, transmitting, and storing electronic data. Risks range from loss of equipment and phishing attacks to ransomware that results in data loss or damage.<sup>1</sup> Use of telehealth increases risks to privacy and security as the IT vendor, practice, and patient must work together.<sup>2</sup> For this reason, practices should implement appropriate security measures to protect patient data, such as encryption (both in transit and at rest), authentication, and access control.<sup>3</sup>

#### HIPAA and Other Considerations

Telehealth does not alter a provider's obligations under HIPAA<sup>6</sup> – the same requirements apply as in-person visits. Use of HIPAA-compliant technology can help a practice meet its compliance obligations through certain features, such as encryption or use of strong passwords.<sup>7</sup> However, these examples do not substitute for an organized, well-documented set of security practices.<sup>8</sup>

HIPAA requires practices and their business associates<sup>9</sup> (BAs) to implement reasonable and appropriate safeguards

<sup>9</sup> A business associate is a person or entity that performs functions that involve the use or disclosure of protected health information on behalf of, or provides services to, a covered entity. More information is available at: [www.hhs.gov/hipaa/for-professionals/privacy/guidance/business-associates/index.html](http://www.hhs.gov/hipaa/for-professionals/privacy/guidance/business-associates/index.html).

(i.e., administrative, physical, and technical controls).<sup>10</sup> A business associate agreement (BAA)<sup>11</sup> is often required with an IT vendor. Practices must also consider applicable state law(s) (e.g., obligations for encryption, consent, and breach notification) as they may be liable for insufficient security safeguards or unauthorized access of protected health information (PHI).<sup>12</sup>

In March 2020, the U.S. Department of Health and Human Services, Office for Civil Rights announced the relaxation of some enforcement activities during the COVID-19 public health emergency. Use of popular, non-public facing video applications (e.g., Skype, Zoom, Apple FaceTime, and Facebook Messenger video chat) is temporarily permitted without risk of penalty for non-compliance with HIPAA. Practices seeking additional privacy protections for telehealth should use vendors that are HIPAA-compliant and will enter into BAAs.<sup>13</sup>

## Practice Tips

Any data transferred over the internet runs the risk of interception by threat actors. This includes use of telehealth to communicate with patients remotely and transmit their biometric data through remote monitoring devices. Cybersecurity refers to preventative measures a practice can take to protect data from being stolen or compromised. Many practices already take steps to protect themselves and their patients. The following are some key considerations for telehealth.

## Educate practice staff

Everyone has a role to play in cybersecurity. Proper guidance to practice staff is essential to increase their awareness about how to recognize security threats; nearly 95 percent of data breaches stem from employee error.<sup>14</sup> Training practice staff should minimally cover how to safeguard PHI and proper data handling procedures. This includes topics, such as:

- Common cyber-attack techniques, like phishing;
- Remote work policies, including permitted forms for remote access (e.g., using a virtual private network or “VPN” connection<sup>15</sup>) and personal device security (e.g., segregation of personal and health care applications and data)<sup>16</sup>; and
- Operating system and security updates.

Initial training should occur, followed by periodic refresher training (at least annually). Training should also be initiated if a change is made to telehealth policies, procedures, or systems.<sup>17, 18</sup>

## **Sign a BAA with vendor(s) that handle PHI**

BAAs protect your practice from liability in the event of a breach by outlining vendor roles and responsibilities, including appropriate uses and disclosures of PHI, and the implementation of certain features and technical specifications using HIPAA-compliant technology.<sup>19, 20</sup>

## **Install system updates timely**

Anti-virus software protects patient data.<sup>21</sup> Automatic “patching” is an easy way to address known vulnerabilities. Consider implementing updates at least weekly.<sup>22, 23</sup>

## **Minimize and detect unauthorized access**

Consider the following access control options:

- Restrict access to permissions based on staff roles
- Encrypt PHI to make it unreadable without a key or password<sup>24</sup>
- Have the capability to remotely disable or wipe IT devices in the event of loss or theft<sup>25</sup>
- Regularly audit data activities to verify users and data accessed, and detect potentially malicious or careless behaviors (e.g., provider looking at health information of individuals not in patient panel)<sup>26</sup>

## **Invest in cybersecurity insurance**

In the event of a breach, insurance may offset the cost of an investigation, HIPAA fines, legal support, and patient notification and credit monitoring.<sup>27</sup>
