4	Change in Number of Emergency Treatment Spaces by Type of Space: Maryland, 2004 - 2009.....	16

Annual Report on Selected Maryland Acute Care Hospital Services: Fiscal Year 2010

Background

This annual report was initiated in 2001 to document and track acute care hospital bed inventory following the implementation of a standardized annual licensure renewal process based on inpatient census. This process involves notifying hospitals prior to the beginning of each fiscal year concerning the calculated total number of licensed acute care beds for the coming fiscal year. In turn, the hospitals identify the allocation of the total licensed acute care beds across four service categories.

In 2005, MHCC implemented supplemental surveys to obtain inventory information for other services provided by acute care hospitals. Emergency department service capacity was added to the report for FY 2005. In 2007, obstetric and surgical service inventories were added to the annual report. Beginning this year, the Commission surveyed special hospitals (psychiatric and non-psychiatric) and acute care hospitals providing special hospital services. Licensed special hospital beds are categorized as pediatric, psychiatric, rehabilitation, chronic and communicable disease beds.

This *Annual Report on Selected Maryland Acute Care Hospital Services: Fiscal Year 2010* has been prepared by the Maryland Health Care Commission's Center for Hospital Services. There are 47 acute care hospitals in Maryland. Licensed acute care hospital beds, which are the types of beds operated by general acute care hospitals and fall into four defined bed categories, are included in this inventory report. The four bed categories are medical/surgical/gynecology/addictions ("MSGA"), obstetric, pediatric and acute psychiatric services. Other acute care hospital service capacities covered in this report include surgical services, perinatal and obstetric services, and emergency department services.

Acute Care Hospital Bed Capacity

Licensed bed capacity for acute care hospitals in the State of Maryland is dynamic, calculated annually as a multiple of average acute care inpatient census over a 12-month period. The Maryland Health Care Commission, in conjunction with the Health Services Cost Review Commission, calculates the average daily census of acute care patients for each hospital for the 12 months ending on March 31st of each year and total licensed acute care bed capacity is established for the next fiscal year at 140% of the hospital's average daily census. This licensure approach yields a number of licensed beds that would have operated at 71.47 average annual occupancy during the 12-month period for which average daily census is calculated.

The initial implementation of this licensure process in 2001 resulted in a statewide reduction in licensed acute care hospital bed capacity of 2,773 beds. However, the total licensed acute care beds have increased each year since the system went into effect in 2001. The annual increase in total licensed beds has ranged from a low of less than 1% (FY 2006, a statewide increase of 2 beds) to a high of 2.5% (FY 2005 and 2008, a statewide increase of 255 beds). There is a statewide increase of 53 licensed beds (0.5%) for FY 2010.

Non-acute care beds located in acute care hospitals are excluded from this annual licensure adjustment process, as are special hospitals. Beginning in 2008, the Commission surveyed special hospitals to include inventories of "special hospital" beds (rehabilitation, chronic care, and long term psychiatric services) in this report, including special hospital beds located on or off general acute care hospital campuses

Licensed Acute Care Hospital Beds in Maryland: FY 2009

Table 1 shows the licensed acute care bed capacity for each acute care hospital, by service, effective July 1, 2010. The calculation of licensed beds for FY 2010 based on each hospital's average daily census from April 1, 2007 through March 31, 2008, results in a total of 10,880 licensed acute care hospital beds in Maryland. This compares to 10,827 licensed beds in FY 2009, an overall statewide increase of 53 beds from FY 2009 to FY 2010. Table 2 shows the eleven-year trend in licensed acute care beds by hospital, beginning with the year just prior to implementation of the licensure process. Table 3 shows the percent change by region.

Source: Maryland Health Care Commission

**Figure 2. Total Licensed Acute Care Beds:
Maryland Hospitals, FY 2001 - 2010**

While the average daily census of acute care patients has been gradually increasing in the current decade, hospital utilization in Maryland is still well below historic peaks. Figure 3 shows the trend of declining acute care census from the early 1980s through 2008, and the extent of the rebound in census that has occurred in the last ten years.

**Figure 3. Trend in Average Daily Acute Care Patient Census:
Maryland Hospitals, CY 1980 - 2008**

Source: Maryland Health Care Commission. Note: Data reported is based on the Hospital Discharge Abstract Data Base for calendar years 1980 - 2008 and reflects the average daily census for all services excluding newborn and rehabilitative services.

Table 4 profiles the FY 2009 - 2010 change in total licensed acute care hospital beds from a regional perspective. Twenty-seven hospitals representing two of Maryland's five health planning regions saw an overall increase in bed capacity. Twenty hospitals and three regions experienced a decline in licensed beds.

Table 4. Change in Number of Total Licensed Acute Care Beds by Region: Maryland Hospitals , FY 2009 - 2010

Region	Total Number of Hospitals	Net Change in Number of Total Licensed Beds	Percent Change	Number of Hospitals with an Increase in Beds	Number of Hospitals with a Decrease in Beds	Number of Hospitals with No Change in Hospital Beds

Table 5 profiles the change in the inventory of licensed acute care hospital beds since 2001 for the four acute care bed service categories. All of the increase has occurred in the MSGA category. The number of beds allocated to pediatric services has declined 7.6%; to obstetric services, 5.2%, and to acute psychiatric services, 0.6%. Although psychiatric beds have not reached the 2001 inventory level there has been a slight, but steady increase (1.6%) of psychiatric beds since 2006.

Table 6 shows the FY 2010 inventory of critical care beds, which are a subset of MSGA beds. Critical care beds comprise 13.3% of the state's licensed MSGA bed inventory, ranging from just over 9% in Western Maryland to 16.5% of licensed MSGA beds in Montgomery County.

From FY2005 to FY2010, the licensed inventory of MSGA beds has increased only slightly faster than the reported number of critical care beds (6.9% for MSGA compared to 6.5% for critical care). Thus, the proportion of total MSGA beds used to provide critical care has remained fairly constant over this period.

Source: Maryland Health Care Commission. Note: Critical care beds include all medical surgical intensive care and coronary care beds and excludes definitive observation/stepdown beds, pediatric intensive care beds and NICU bassinets. Critical care beds are part of the larger MSGA bed inventory.

Table 7 identifies the proportion of total licensed acute care beds, by hospital, which the hospital identified as being hard-wired for cardiac monitoring. From 2007 to 2009, the number of monitored beds reported by Maryland's acute care general hospitals increased 12.2%, increasing from 38.5% of total licensed bed capacity to 42.4%.

Source: MHCC Supplemental Survey: Inpatient Monitoring Capacity, 2009. Data are self reported. Capacity for inpatient monitoring means that hard-wired cardiac monitoring is available for the reported numbers of beds. Note: The percentage shown reflects total licensed beds and does not necessarily reflect the actual complement of beds set up and staffed by the hospital.

Table 8 profiles the trend in licensed acute care beds among hospitals that are members of multi-hospital systems and hospitals that are independent. In the past year, two hospitals, Montgomery General Hospital and Chester River Hospital Center, joined systems (MedStar Health and The University of Maryland Medical System, respectively), increasing the proportion of Maryland's acute care general hospitals in the state's eight multi-hospital systems to fifty-nine percent.

Source: Maryland Health Care Commission. Systems are multi-hospital systems with more than one hospital in Maryland. *Two general hospitals located in Washington D.C. are part of the MedStar Health System; the Washington Hospital Center with 926 licensed beds and Georgetown University Hospital with 535 licensed beds. The total number of acute beds operated by MedStar, including Washington Hospital Center and Georgetown University Hospital is 2,754. **MedStar Health has notified the Commission of the planned acquisition of St. Mary's Hospital of St. Mary's County with an anticipated closing on or after September 2009.

Total Available Acute Care Bed Capacity

The Commission surveys hospitals for the total number of acute care beds they could physically accommodate, if necessary. Available acute care bed capacity is defined as the total number of acute inpatient beds that are available for use, or that could be physically set up in space appropriate for licensed acute inpatient care, as admissions might warrant. It is a physical count of beds based on the available patient rooms with headwalls, measuring the maximum operating capacity under normal, non-emergency circumstances, rather than a measure of staffing capacity.

The survey shows that 28 general hospitals in Maryland with 4,872 licensed acute care beds report the availability of physical bed capacity that exceeds their licensed capacity. These 28 hospitals, in the aggregate, report a physical capacity for 5,972 beds. This excess physical bed capacity (1,100 beds) would potentially be available to accommodate short term growth in demand and, if necessary, major emergencies and disasters, so long as staffing resources could be secured. The Southern Maryland region has the greatest excess, with reported physical bed capacity exceeding licensed bed capacity by 388 beds, followed by Western Maryland, with 312 more physical beds than licensed beds.¹ The Eastern Shore is reported to have 97 more physical than licensed beds.

Sixteen hospitals report that their physical capacity for acute care beds, as of June, 2008, is less than their licensed bed capacity. These hospitals have a combined total of 5,472 licensed acute care beds and report that, in the aggregate, they only have physical capacity to set up 5,127 acute care beds, a shortfall of 345 beds.² These hospitals are highly concentrated in the Central Maryland region, which accounts for 13 of the 16 hospitals in this group.

Statewide, the Commission's June 1, 2009 survey identifies a net of 755 beds of physical bed capacity in excess of licensed bed capacity. The results of this survey are shown in Table 9.³

¹ The Western Maryland excess is concentrated in Allegany County, where replacement of two general hospitals with a single hospital is underway. This project will bring licensed and physical bed capacity into a much closer balance.

² Five of these hospitals have CON-approved bed additions underway. Four others are implementing expansion projects that will increase their effective bed capacity, by replacing semi-private rooms with private rooms and/or adding beds to reach their licensed bed capacity.

³ The data are self reported and not verified by the Commission. To the extent possible, the Commission is verifying hospital total available capacity on a case by case basis, primarily as part of the review of hospital expansion, renovation, and replacement projects submitted under the Certificate of Need Program.

Note: Total available physical capacity is defined as the total number of acute inpatient beds that are available for use, including those that could be physically set up in space appropriate for licensed acute inpatient care as admissions might warrant. This should be a count of potentially available physical bed capacity rather than a measure of staffing capacity or a reflection of current use of patient care rooms. This is determined by the number of headw alls and/or gas lines that could be made available for inpatient use, without renovations. Rooms with two headw alls/gas lines should be counted as having capacity for two beds, and rooms with one headw all/gases should be counted as having capacity for one bed, regardless of their current use. It does not include space currently used for non-acute or special hospital beds.

Emergency Department/Center Treatment Capacity

Maryland has 46 emergency departments located in acute care hospitals and additional emergency treatment spaces at two freestanding centers operated by hospital organizations that provide emergency services.⁴ Bowie Health Center, located in Prince George's County, has 21 treatment spaces allocated to emergency care. The Shady Grove Emergency Center at Germantown in Montgomery County also has 21 treatment spaces.

Table 10 shows the change in emergency department/center treatment capacity from a regional perspective. Eight (8) emergency departments increased capacity. Four emergency departments showed a decline in the number of treatment spaces from 2008 to 2009. Overall Maryland emergency departments/centers reported an increase of 20 (1.17%) treatment spaces.

**Table 10. Change in Emergency Department/Center Treatment Capacity:
Maryland, 2008 - 2009**

REGION	Total Number of Emergency Departments and Centers	Net Change in Emergency Treatment Spaces	Percent Change in Capacity in Emergency Treatment Spaces	Emergency Departments or Centers with an Increase in Capacity	Emergency Departments or Centers with a Decrease in Capacity	Emergency Departments or Centers with No Change in Capacity

Hospital Surgical Services Capacity

Table 13 displays the inventory of sterile operating rooms, by room type, excluding dedicated cesarean section rooms. Table 14 profiles the inventory of dedicated cesarean section operating rooms and procedure rooms. Procedure rooms are rooms used for endoscopy, cystoscopy, or other minor procedures and many are not sterile rooms, and thus, are only appropriately used for “closed” procedures that do not involve surgical incisions.

Special Hospital Services, Comprehensive Care Facilities in the Hospital Setting, and Hospital-Based Psychiatric Inpatient Care

Special hospitals are facilities that have an organized medical staff of physicians and that include inpatient beds with medical services. The medical services include physician services and continuous registered professional nursing services, for not less than 24 hours every day, to provide diagnosis and treatment for patients who have specific medical conditions. In Maryland, special hospitals provide specialized rehabilitation, chronic care, pediatric and psychiatric services. Special hospital beds may be located on the campus of an acute general hospital. In these cases, they are separately licensed from acute care beds. Special hospital beds are not included in the annual licensure process for acute care beds located in acute care general hospitals.

Special Hospital Medical Rehabilitation Services

Acute inpatient rehabilitation is defined, at COMAR 10.24.09, as interdisciplinary care provided to persons with disabilities who are at high risk of potential medical instability, have a potential for needing skilled nursing care of a high medical acuity, and require a mix of services, service intensity levels, and settings of the following type:

1. Regular, direct individual contact by a physiatrist or physician of equivalent training and/or experience in rehabilitation who serves as their lead provider;
2. Daily rehabilitation nursing for multiple and/or complex needs;
3. A minimum of three hours of physical or occupational therapy per day, at least five days per week, in addition to therapies or services from a psychologist, a social worker, a speech-language pathologist, and a therapeutic recreation specialist, as determined by the individual needs; or
4. Based on their individual needs, other services provided in a health care facility that is licensed as a hospital.

There are five (5) special hospitals licensed to provide medical rehabilitation services in Maryland and eleven (11) Maryland acute care hospitals have special hospital units that provide medical rehabilitation services. Table 18 profiles the types of rehabilitation programs offered at these facilities, the number of licensed beds, and the number of licensed beds that are regularly staffed. Staffed beds are defined as the number of beds regularly maintained (set up and staffed for use) for inpatients. In this table, adult patients are defined as 18 years of age and older and pediatric patients are patients under the age of 18. The program listings are medical rehabilitation services that are accredited by the Commission on Accreditation of Rehabilitation Facilities (CARF). CARF is an independent nonprofit accrediting body of human service providers in the areas of aging services, behavioral health, child and youth services, durable medical equipment, prosthetics, orthotics and orthotic supplies, employment and community services, medical rehabilitation, and opioid treatment programs. CARF accreditation is required by the State of Maryland for licensure of rehabilitation facilities.

Notes: Licensed Beds for Adventist Rehabilitation Hospital of Maryland at Tacoma Park are included in Adventist Rehabilitation of Maryland. Adventist Rehabilitation is CARF accredited for Amputation Specialty Program (Adults)

Other Special Hospital Services (non-psychiatric)

Pediatric

Facilities with beds licensed as Special Hospital – Pediatric are used to provide specialized inpatient services to patients less than 18 years of age. There are two special hospitals in Maryland dedicated to providing specialized pediatric services. Both hospitals provide rehabilitation and other special hospital services and are located in Baltimore City. (See Table 19)

Chronic Care

Facilities with beds licensed as Special Hospital - Chronic provide continuous and intensive medical, nursing, and ancillary services to medically-complex patients with severe illness who require close professional monitoring and observation and frequent medical interventions, either after an acute hospital phase of care or as a result of acute exacerbations of illness while residing in other settings, such as a the patient's home or a nursing home (comprehensive care facility).

Seven facilities in Maryland are licensed to provide special hospital-chronic care and these facilities have a total of 458 licensed beds, of which 353 are reported to be regularly staffed. The seven special hospitals providing chronic care range in size from 28 to 180 licensed beds. Five chronic hospitals are private, and two are state-operated. The five private chronic special hospitals are located in the Central and Southern Maryland regions. The two state operated chronic hospitals are each located in the less densely populated Health Planning Regions of Western Maryland and the Eastern Shore. Additionally two acute care hospitals, both located in Baltimore City, have a total of 100 chronic care beds located on their campuses, which are staffed to licensed capacity. Chronic beds located on an acute care hospital campus are

licensed separately and are not part of the annual acute care bed licensure process. Tables 19 and 20 show the licensed capacity of individual hospitals and the number of beds regularly staffed, by jurisdiction and region.

Comprehensive Care Beds in the Hospital Setting

Comprehensive Care Facilities are licensed in accordance with COMAR 10.07.02. These facilities admit patients suffering from disease or disabilities, or advanced age, requiring medical service and nursing service rendered by or under the supervision of a registered nurse. The vast bulk of comprehensive care facility services are provided in Maryland through freestanding (non-hospital) comprehensive care facilities, commonly known as nursing homes. However, this type of inpatient facility service is also offered by 10 acute care general hospitals (Table 21) and by four facilities that combine special hospital comprehensive care facility services (Table 22).

*Deer's Head Center is licensed for 80 comprehensive care beds; the facility is currently budgeted for 66 comprehensive care beds.

Psychiatric Hospital Facilities and Services

In Maryland, two types of hospital-level inpatient psychiatric services are provided; acute psychiatric services and long-term, continuing care. Most acute inpatient psychiatric care is provided within the acute care general hospital setting at 28 general hospitals. These psychiatric beds are included in the annual “dynamic” licensure process for all acute care beds located in acute care general hospitals, in which the licensed acute care bed inventory is based on recorded average daily census. Hospital-level psychiatric inpatient care outside of the acute care general hospital setting can be found in freestanding private hospitals or in state hospitals. The psychiatric beds in these two types of facility types are licensed as a category of “special hospital” bed under the State’s licensing statute. Freestanding private psychiatric hospitals primarily provide acute psychiatric inpatient services. State psychiatric hospitals primarily provide long-term, continuing care psychiatric inpatient services.

Table 23 provides an overview of the acute psychiatric inpatient service bed capacity and program characteristics of general acute care hospitals. In general, services for children are provided to a patient population under the age of 13 years, adolescent services are provided to patients aged 13 to 17, and adult services are provided to patients aged 18 years and older.

EASTERN SHORE							

Source: Maryland Health Care Commission survey of psychiatric services capacity, June, 2009.

Note: Braddock, Washington County, and Howard County General reported that adolescents (defined as 16+) may be provided services in the same section as adults. Suburban combines adolescents (13+), adults and geriatric in a combined unit. Adult and Geriatric units are combined at Frederick Memorial, Laurel Regional, Prince George's Hospital, Sinai, Northwest, and St. Joseph's Hospital.

Tables 24 and 25 profile psychiatric inpatient service capacity and inpatient program characteristics at Special Hospitals – Psychiatric. Table 24 identifies the licensed bed capacity and the number of reported regularly staffed beds at Maryland's five freestanding private psychiatric hospitals. Table 25 identifies the number of licensed beds and "budgeted" beds, at Maryland's seven state-operated psychiatric hospitals. The number of "budgeted" beds provides a more accurate reflection of the bed capacity that is typically set up and staffed at these facilities than the number of licensed beds.

Partial Hospitalization Programs (PHP) and Intensive Outpatient Programs (IOP) for psychiatric patients are also provided in the acute care general hospital setting and the special hospital setting. PHPs and IOPs are organized day or night programs providing assessment, treatment, habilitation, or rehabilitation services for persons who do not require inpatient care on a 24-hour basis. This may be a structured, ongoing program that the patient typically attends 2 to 5 times a week for 2 to 5 hours per day providing clinical behavioral health services. The plan of care is prescribed by and overseen by a psychiatrist. PHPs may be used as a “step-down” from inpatient care or a “step-up” from less intensive outpatient programming and are sometimes called “day hospital” programs. Services are usually provided in a group setting for at least 4 hours of direct clinical care per day, with additional individual and/or family therapy and medication management as needed. IOPs are a subset of PHPs and would typically involve fewer sessions per week and/or fewer hours per daily session. IOPs may be used as a “step-down” from PHPs or a “step-up” from less intensive outpatient care outside of the institutional setting.

MHCC surveyed the availability of PHPs and IOPs at hospitals, requesting information on the maximum number of treatment “slots” available and the daily program census on four specific dates between September, 2008 and June, 2009. Tables 26 and 27 profile these programs as offered in 22 acute care general hospitals and five freestanding private psychiatric hospitals, respectively. State-operated psychiatric hospitals do not provide PHP or IOP services. [NOTE: Average daily census is the average number of treatment slots reported by the hospitals on four specific dates between September, 2008 and June, 2009.]

The following tables profile psychiatric hospital bed capacity, for the three types of hospital settings, across several bed capacity dimensions, including licensed beds, physical bed capacity, and staffed beds. They also provide recent patient day and bed occupancy rate information. In

the case of the State psychiatric hospitals, the budgeted bed capacity is also included. [The average annual bed occupancy rate reflects the ratio of CY2008 average daily census (CY2008 patient days /366) to reported June 1, 2009 staffed beds.

Baltimore County/ Central Maryland	Sheppard Pratt Hospital	322	322	230		
Howard County/ Central Maryland	Sheppard Pratt at Ellicott City	92	92	70	87,582	58%

Sources: Licensed Beds, Office of Health Care Quality; Physical Capacity and Staffed Beds, Maryland Health Care Commission 2009 Survey; Psychiatric Service Capacity; Patient Days, Health Services Cost Review Commission, Discharge Database, CY2008.

Licensed Bed Occupancy is calculated using the formula, (patient days)/(Licensed beds*365).

Sheppard Pratt and Potomac Ridge combine their sites patient data when reported to HSCRC.

*St. Luke Institute predominately serves clients from Catholic religious orders and do not report utilization data to HSCRC.

Table 30. Inventory and Utilization of Psychiatric Beds at State Special Hospitals - Psychiatric: Maryland, 2009

Jurisdiction/Region		Beds, June 1, 2009						Patient Days CY 2008	Staffed Occupancy CY 2008
		Licensed Beds	State Budgeted Beds	Physical Capacity		Staffed Beds			
				Acute Care	Continuing Care	Acute Care	Continuing Care
